### prefetcher.hpp

Alterar esta estrutura para:
- std::vector<uint64\_t> prefetch\_waiting\_complete;
+ std::vector<memory\_package\_t \*> prefetched\_lines;

(precisamos manter um rastreio de quando a requisição está pronta)

## prefetcher.cpp - prefetch

Impede mais requisições de prefetch que o limite

if (this->prefetched\_lines.size() >= PARALLEL\_PREFETCH) {
 return;

/\* Remove esse mais antigo que já está completo \*/
delete this->prefetched\_lines.begin();
this->prefetched\_lines.erase(this->prefetched\_lines.begin());

# Criação de uma nova entrada de prefetch

memory\_package\_t \*pk = new memory\_package\_t();
this->prefetched\_lines.push\_back(pk);

#### Onio a Sanda na sata D

pk->opcode\_address = 0x0;
pk->memory\_address = newAddress;
pk->memory\_size = mob\_line->memory\_size;
pk->memory\_operation = mob\_line->memory\_operation;
pk->status = PACKAGE\_STATE\_UNTREATED;
pk->is\_hive = false;
pk->is\_vima = false;
pk->hive\_read1 = mob\_line->hive\_read1;
pk->hive\_read2 = mob\_line->hive\_read2;
pk->hive\_write = mob\_line->hive\_write;
pk->readyAt = orcs\_engine.get\_global\_cycle();
pk->born\_cycle = orcs\_engine.get\_global\_cycle();
pk->sent\_to\_ram = false;
